

Fencing Matters

Issue 10 December 2020

Crash, Bang, Wallop!

Crash barrier is commonly seen on the UK highways, providing valuable protection in the case of vehicle accidents. But that's not the only place to use it. Frequently this product is used to protect buildings, lamp columns, walls and seen here, bin stores. With 90 degree corners, radius sections and fish tail ends, the ease of cutting beams to

suit site lengths, it's a useful method of protecting property from vehicle and site traffic. Posts can be bolt down or root fixed, and can be extra high to allow for double beams. Posts can also be sprung steel bolt down, giving the posts some flex if they are hit. In the pictures here it has been installed on a new industrial site in Fareham. Used on the edge of the access way with added handrails to prevent pedestrian falls over the retaining wall behind.

Contemporary Panels

Creating a more urban feel, these contemporary panels are a twist on the well used palisade fencing. But despite their appealing style, the size of the horizontal battens create an inherent weakness. As they've gained in popularity we have looked at the design and tweaked the size of the battens, now making these a viable alternative for a modern garden fence.

FI RE! FI RE!

Emergency exits have long been a mandatory part of building design not just internally but externally too. Emergency exits that dispel people into an external space with locked inaccessible gates are unsafe. But unless the gate is designed properly, putting an emergency push pad on a gate could mean compromising security. And the same goes for using a keypad. All our emergency exit gates are fabricated with shrouds or mesh that prevent intruders passing a limb through the gate and operating the push pad or keypad from the wrong side. Sound obvious? Not every gate manufacturer thinks of that—that's why we like to make our own gates!

Never Not Good!

Super versatile with three pale top choices, a wide range of heights, endless colour options, anti-tamper fixings, additional anti-intruder toppings, bolt down or root fixed posts, self-raking, easily accommodates site dimensions, and gates to match—what's not to love about steel palisade fencing! Where will you use yours? 😊

Compounds Abound!

Another compound installation, but using the also much loved, welded mesh panel system! Another spoilt for choice system, but maybe that's an article for another day!

*Merry Christmas and a
Happy New Year to all our
customers*

*Here's to a more normal
2021!*
